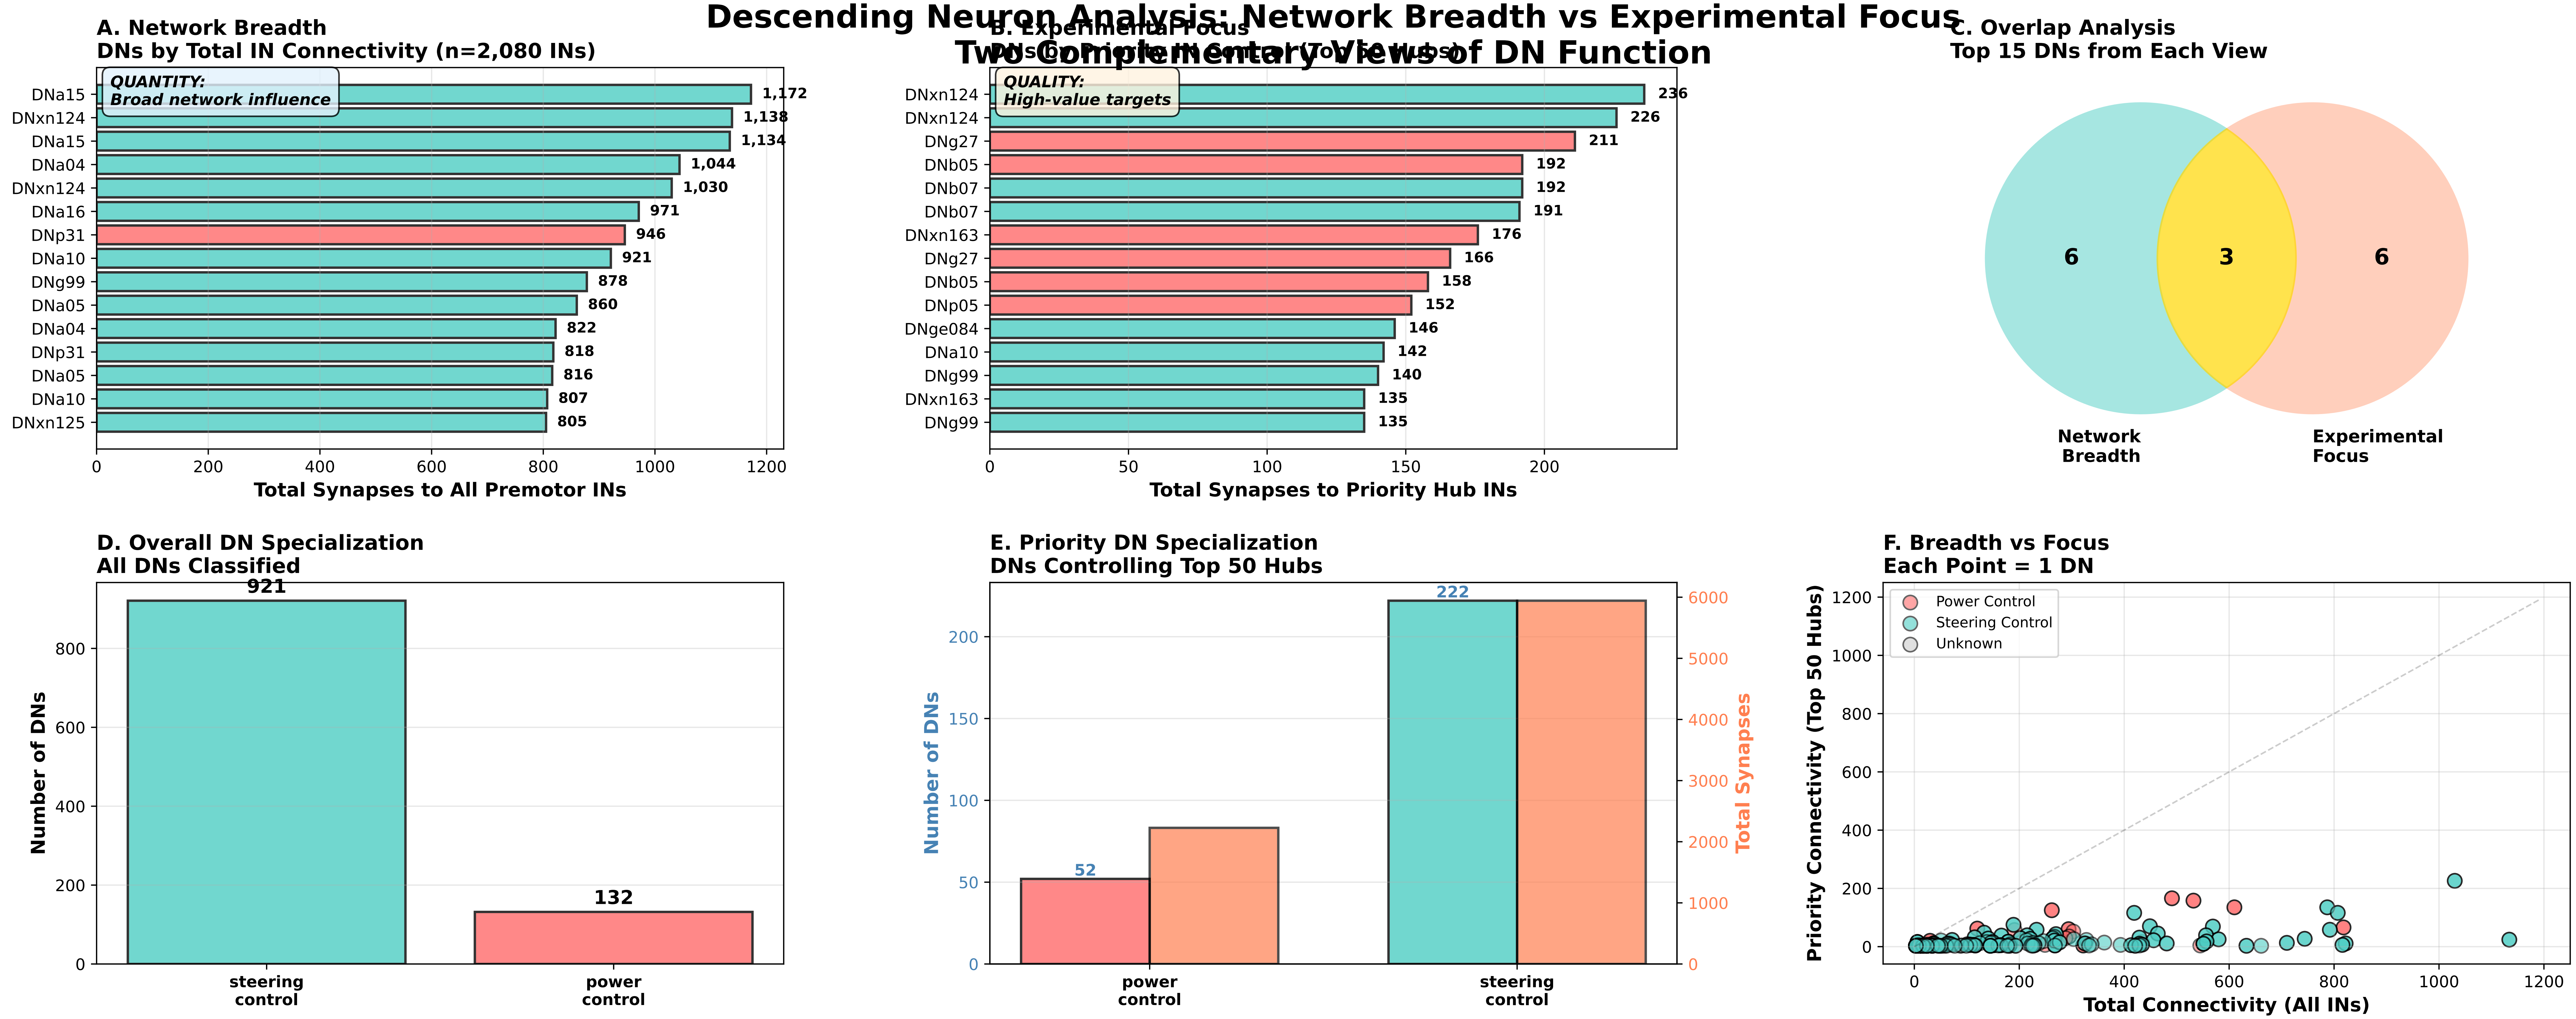
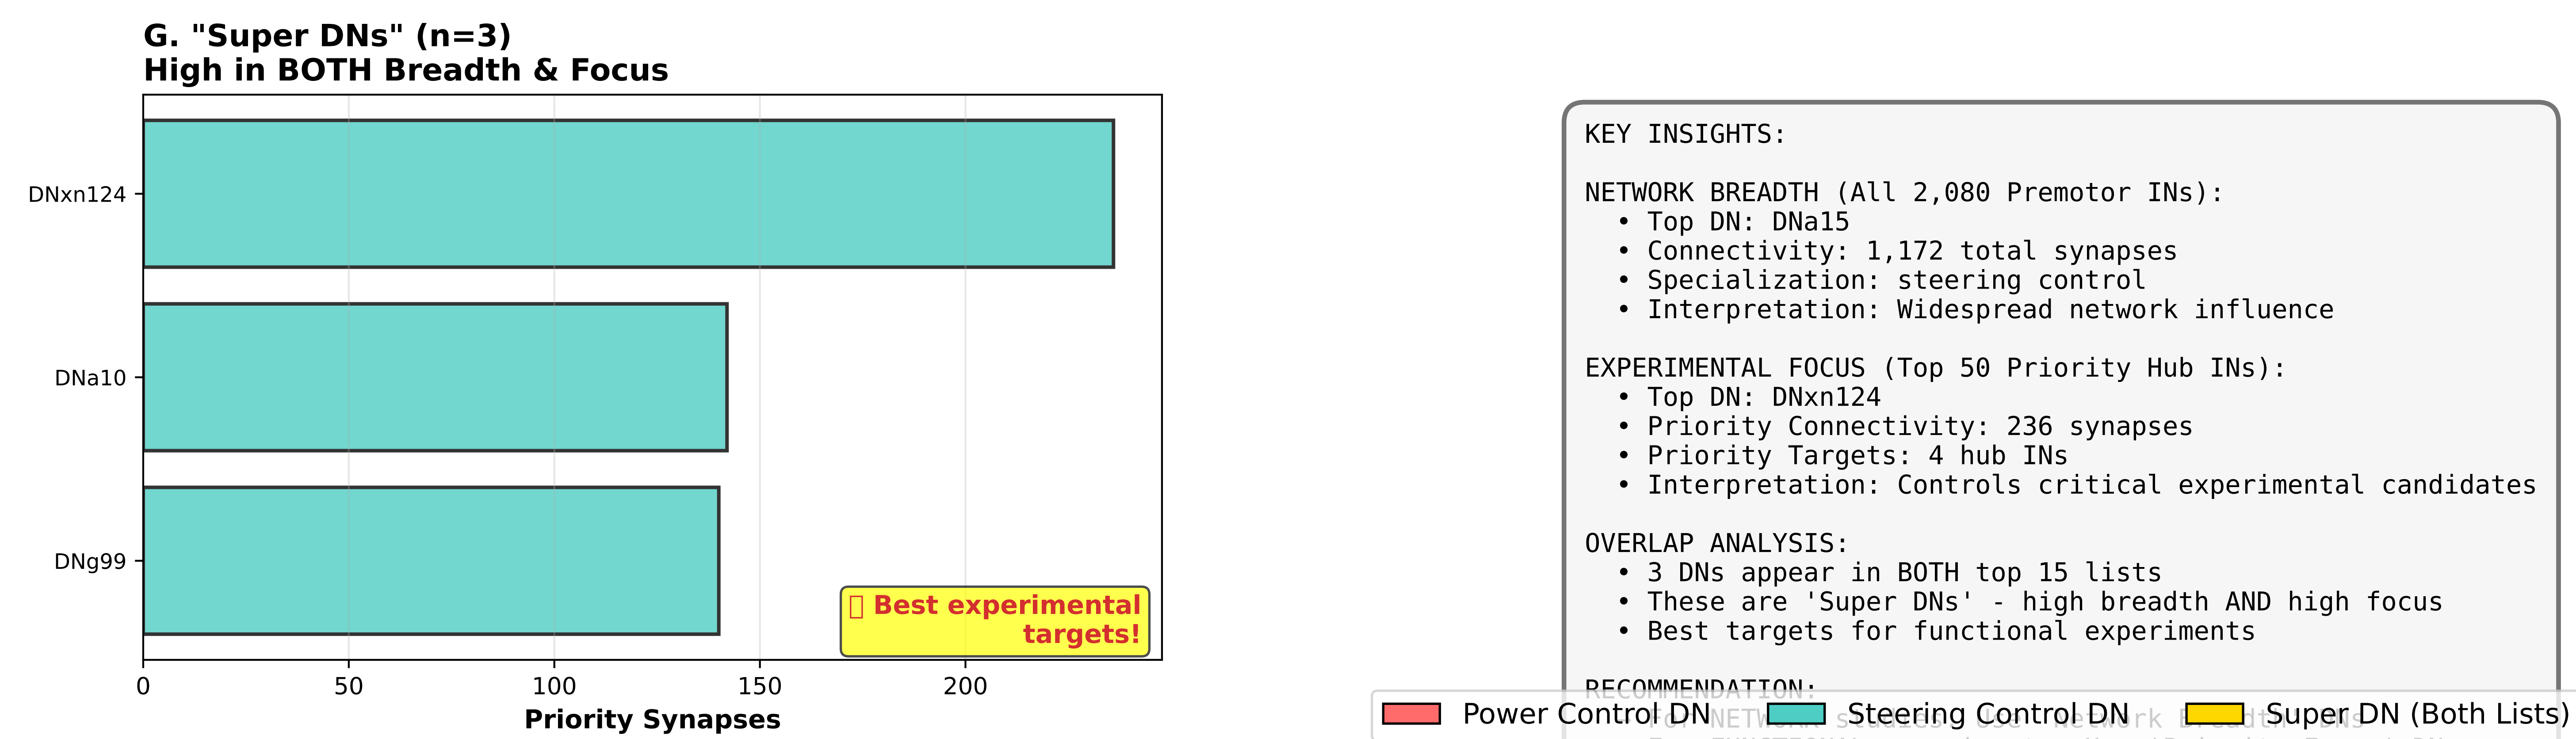
Descending Neuron Analysis: Network Breadth vs Experimental Focus
Two Complementary Views of DN Function





KEY INSIGHTS:

NETWORK BREADTH (All 2,080 Premotor INs):
- Top DN: DNa15
- Connectivity: 1,172 total synapses
- Specialization: steering control
- Interpretation: Widespread network influence

EXPERIMENTAL FOCUS (Top 50 Priority Hub INs):
- Top DN: DNxn124
- Priority Connectivity: 236 synapses
- Priority Targets: 4 hub INs
- Interpretation: Controls critical experimental candidates

OVERLAP ANALYSIS:
- 3 DNs appear in BOTH top 15 lists
- These are 'Super DNs' - high breadth AND high focus
- Best targets for functional experiments

RECOMMENDATION:
→ For NETWORK studies: Use 'Network Breadth' DNs
→ For FUNCTIONAL experiments: Use 'Priority Focus' DNs
→ For HIGH-IMPACT studies: Use 'Super DNs' (overlap)
