

Synapse Threshold Comparison: Impact on Network Structure and Clustering

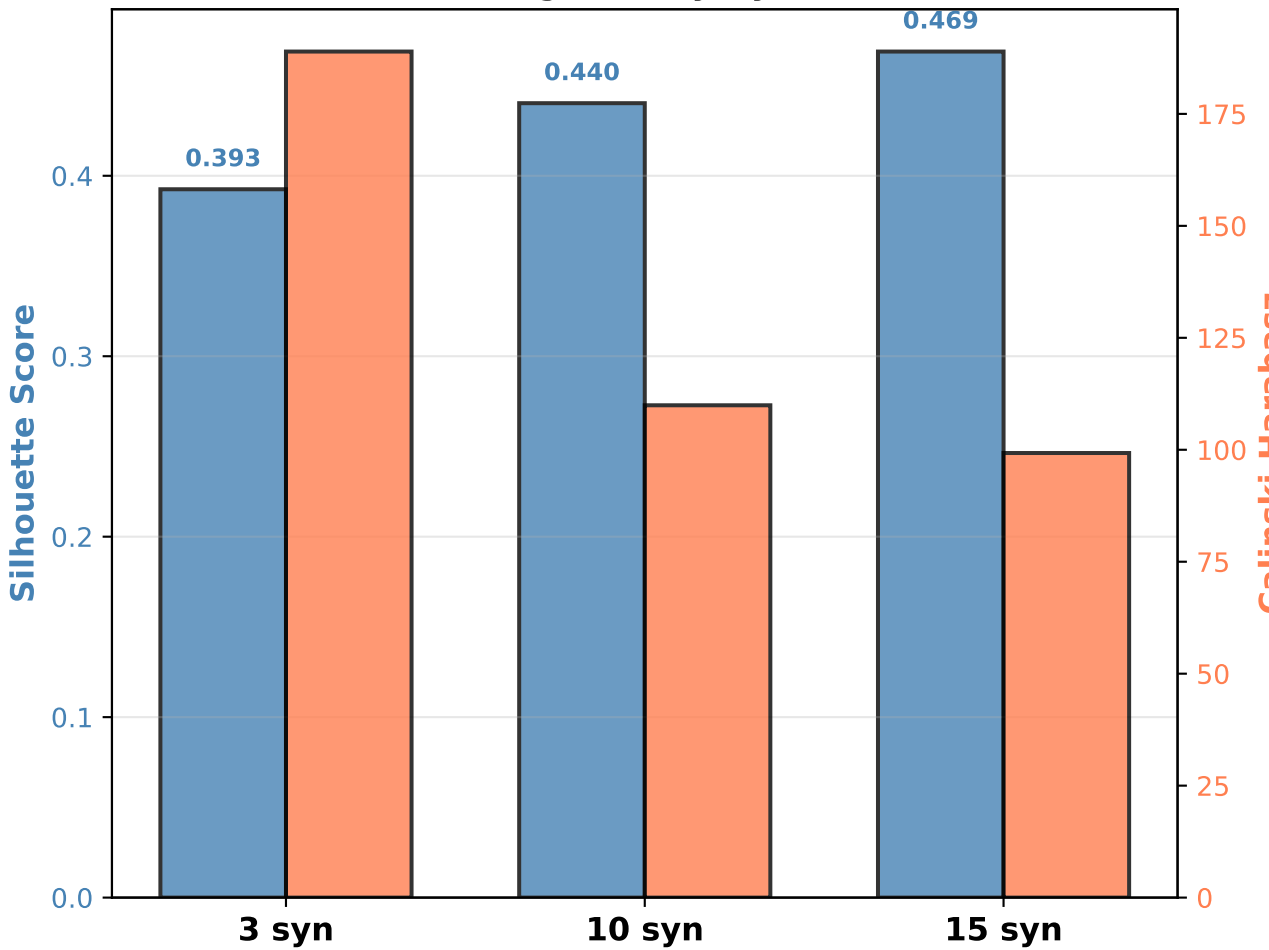

A. Network Size by Threshold

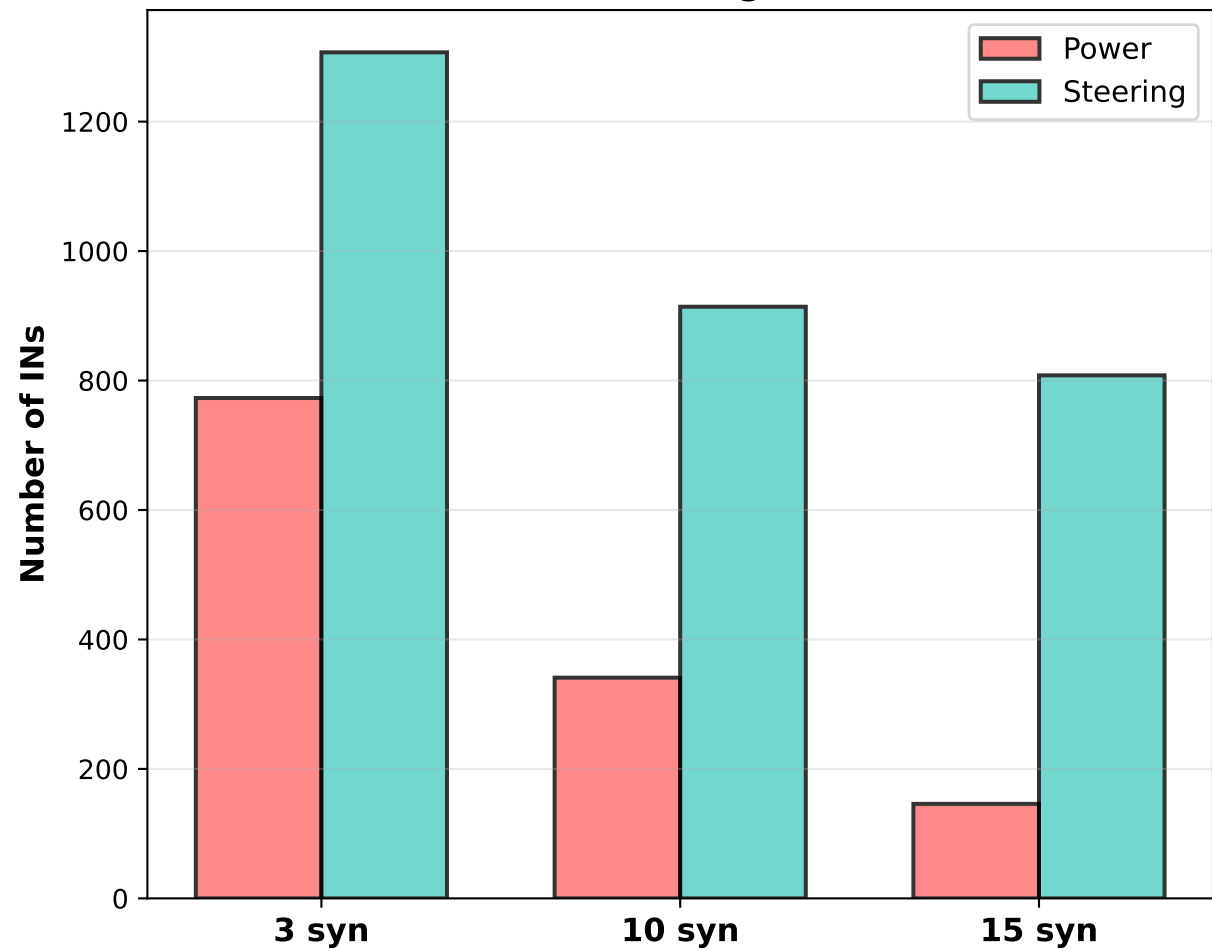

B. Connection Count by Threshold

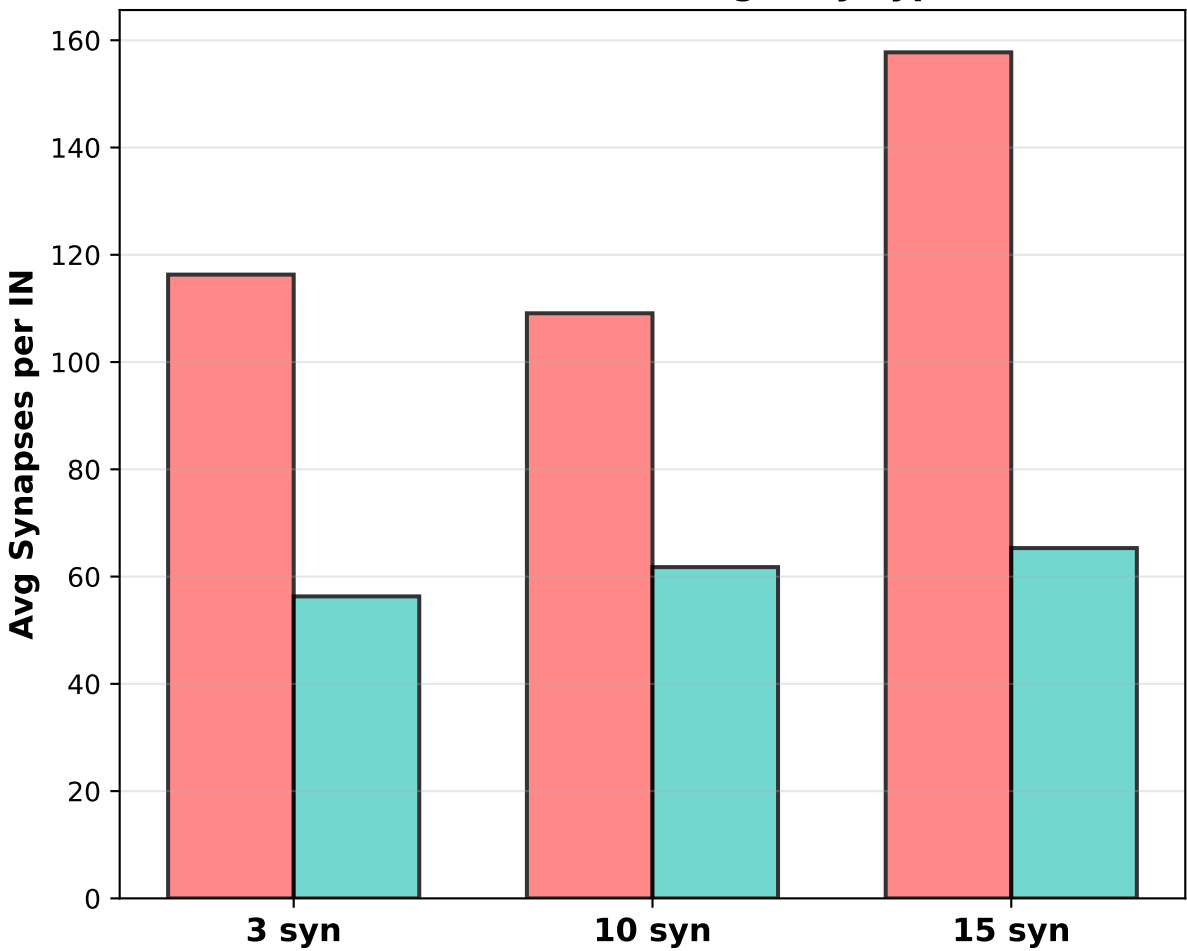

C. Clustering Quality by Threshold

D. Power vs Steering Distribution

E. Connection Strength by Type

THRESHOLD COMPARISON SUMMARY:

```
min_synapses = 3:
  • Premotor INs: 2,080
  • Connections: 17,665
  • Silhouette: 0.393
  • Calinski-H: 188.9
  → CURRENT (comprehensive)

min_synapses = 10:
  • Premotor INs: 1,255
  • Connections: 5,044
  • Silhouette: 0.440
  • Calinski-H: 109.9
  → RECOMMENDED (strong, clean)

min_synapses = 15:
  • Premotor INs: 954
  • Connections: 2,920
  • Silhouette: 0.469
  • Calinski-H: 99.3
  → AGGRESSIVE (may lose circuits)

RECOMMENDATION:
Use min=10 for:
  • High-confidence pathways
  • Cleaner clustering
  • Focused experiments

Keep min=3 for:
  • Complete network view
  • Distributed circuits
  • Comprehensive analysis
```
